## Official Product Knowledge Base

[AI Platform](#) | [CRM Features](#) | [Cloud Storage](#) | [Integrations](#) | [Roadmap](#) | [Product FAQ](#)

Document Version 2.4 • Effective Date: January 1, 2026

Prepared by: NimbusFlow Product & Engineering Team

Classification: Public — for use by customers, support agents, and AI assistants

This document is a fictional company knowledge base created for educational use in an AI/RAG (Retrieval-Augmented Generation) capstone project. NimbusFlow is not a real company.

# Table of Contents

|                           |    |
|---------------------------|----|
| 0. About NimbusFlow ..... | 3  |
| 1. AI Platform .....      | 5  |
| 2. CRM Features .....     | 15 |
| 3. Cloud Storage .....    | 25 |
| 4. Integrations .....     | 33 |
| 5. Roadmap .....          | 41 |
| 6. Product FAQ .....      | 45 |
| 7. Appendix .....         | 49 |

Note: Page numbers above are approximate. This document is intended to be chunked and embedded into a vector database (e.g., FAISS or ChromaDB) for use by the Product Agent of the Multi-Agent AI Customer Support Assistant.

# 0. About NimbusFlow

NimbusFlow is a business software company founded in 2017, headquartered in Denver, Colorado, with additional engineering offices in Toronto, Canada and Lisbon, Portugal. NimbusFlow builds an integrated business software suite for small and mid-sized companies, combining an AI platform, a customer relationship management (CRM) system, and cloud file storage into a single connected workspace, accessible at [app.nimbusflow.example](https://app.nimbusflow.example) and through native desktop and mobile apps.

This knowledge base documents NimbusFlow's product capabilities in detail — the AI Platform, CRM Features, Cloud Storage, Integrations, the public Roadmap, and answers to the most common product questions — and is used to ground the Product Agent within NimbusFlow's AI-powered customer support assistant. Billing, account access, and technical troubleshooting topics are covered in NimbusFlow's separate Billing and Technical Support knowledge base documents and are referenced here only where directly relevant to a product capability.

## Company Facts

| Attribute                | Detail                                                                                                                            |

## Plan Tiers Referenced Throughout This Document

- **Starter** — for individuals and very small teams getting started with core CRM and storage features.
- **Growth** — adds AI Platform features, automation, and higher usage limits for growing teams.
- **Business** — adds advanced reporting, integrations, and team management for established companies.
- **Enterprise** — custom pricing, dedicated support, advanced security/compliance, and unlimited usage tiers.

Detailed pricing for each tier is maintained in NimbusFlow's Billing Knowledge Base; this document focuses on which capabilities are available at each tier rather than exact pricing, since pricing is reviewed independently of feature availability.

# 1. AI Platform

The NimbusFlow AI Platform is a set of AI-powered capabilities woven throughout the NimbusFlow suite, available starting on the Growth plan, with advanced capabilities reserved for Business and Enterprise. This chapter describes each AI Platform capability, how it is configured, its data handling model, and its current limitations.

## 1.1 NimbusFlow Copilot

Copilot is an AI assistant embedded across the NimbusFlow suite, accessible via a persistent side panel or a keyboard shortcut (Cmd/Ctrl+K) from any screen. Copilot can draft CRM follow-up emails, summarize a deal's history, answer questions about data stored in a customer's NimbusFlow workspace ("What did we discuss with Acme Corp last quarter?"), generate a status report across a filtered set of records, and execute certain actions directly (creating a task, updating a deal stage) when explicitly confirmed by the user. Copilot only has access to data within the requesting user's own permission scope; it cannot surface records a user would not otherwise be able to view directly in the CRM or Cloud Storage.

### 1.1.1 Copilot Modes

| Mode    | Description                                                                                       |
|---------|---------------------------------------------------------------------------------------------------|
| Ask     | Answers questions grounded in the customer's own NimbusFlow data                                  |
| Draft   | Generates email, note, or summary drafts for the user to review and send                          |
| Act     | Performs a specific action (e.g., update a field, create a task) after explicit user confirmation |
| Analyze | Produces a structured summary or report across a filtered set of records                          |

### 1.1.2 Copilot Data Handling

Copilot uses a combination of NimbusFlow-hosted language models and, for certain advanced requests, a third-party foundation model provider under a contract that prohibits the provider from training on NimbusFlow customer data. Customer data sent to a third-party provider for processing is not retained by that provider beyond the time needed to generate the response. Enterprise customers may opt into "AI Platform — Isolated Mode," which restricts Copilot to NimbusFlow-hosted models only, for organizations with data residency requirements that preclude any third-party model usage.

## 1.2 Predictive Analytics

Predictive Analytics surfaces AI-generated forecasts and scores across CRM data, including deal win-probability scoring, revenue forecasting by team or territory, and churn-risk scoring for existing accounts based on engagement signals such as declining email response rates or reduced product usage (for customers who have connected their own product's usage data via the API, described in Chapter 4).

### 1.2.1 Deal Win-Probability Scoring

Each open deal in the CRM pipeline displays an AI-generated win-probability percentage, recalculated nightly based on factors including deal stage, time in stage relative to the team's historical average, engagement recency, and deal size relative to the account's history. This score is informational and does not automatically change deal stage or trigger any workflow on its own; sales teams may optionally build automations (Section 1.3) that react to a win-probability threshold.

### **1.2.2 Revenue Forecasting**

Forecasting rolls up weighted pipeline value (deal value multiplied by win probability) into team-level and company-level forecast views, available under Analytics > Forecast. Sales managers can override an individual rep's forecast commitment manually, which is tracked separately from the AI-generated projection so that both can be compared over time to improve forecasting accuracy.

### **1.2.3 Churn-Risk Scoring**

For customers who have connected product usage data via the NimbusFlow API or a supported integration, churn-risk scoring flags accounts showing a meaningful negative trend in usage, support ticket volume, or engagement compared to their own historical baseline, rather than compared to other accounts, since healthy usage levels vary significantly by account size and industry.

## **1.3 Workflow Automation Builder**

The Automation Builder is a visual, trigger-action workflow editor available on Growth and above. Automations consist of a trigger (a CRM event, a scheduled time, or a webhook from an external system), optional conditions, and one or more actions (send an email, create a task, update a field, call a webhook, or trigger a Copilot Act-mode action).

### **1.3.1 Available Triggers**

- Record created, updated, or deleted (Contact, Company, Deal, Task).
- Deal stage changed.
- Field value changed to a specific value.
- Scheduled — runs on a recurring schedule (daily, weekly, monthly) or a one-time future date.
- Inbound webhook — triggered by an external system calling a NimbusFlow-provided URL.
- Form submission — triggered when a NimbusFlow-hosted web form is submitted.

### **1.3.2 Available Actions**

- Send an email (using a saved template, with merge fields).
- Create or update a task, deal, contact, or company record.
- Post a message to a connected Slack or Microsoft Teams channel.
- Call an external webhook with a custom JSON payload.
- Wait/delay before continuing to the next step.

- Branch based on a condition (if/else logic).

### 1.3.3 Automation Limits by Plan

| Plan       | Active Automations | Monthly Automation Runs |
|------------|--------------------|-------------------------|
| Starter    | Not available      | N/A                     |
| Growth     | 25                 | 10,000                  |
| Business   | 150                | 100,000                 |
| Enterprise | Unlimited          | Unlimited               |

## 1.4 Custom Model Studio (Enterprise)

Model Studio, available on Enterprise plans, allows customers to fine-tune a NimbusFlow-hosted language model on their own historical CRM and support data (e.g., past won/lost deal notes, support resolution notes) to produce more tailored Copilot responses and predictive scores for their specific business. Fine-tuning jobs run in an isolated environment per customer; a fine-tuned model is never shared with or exposed to any other NimbusFlow customer. Model Studio requires a minimum of 500 historical records of the relevant type to produce a meaningfully improved model.

## 1.5 AI Platform Data Connectors

Beyond the native CRM and Cloud Storage data already available to Copilot and Predictive Analytics, customers can connect additional data sources specifically to enrich AI Platform features, including a customer's own product usage/event data (via API), support ticketing data from a connected help-desk integration, and marketing campaign data from a connected email marketing platform. Connected data sources are used only for the AI Platform features that data type is relevant to (for example, product usage data feeds churn-risk scoring but is not surfaced directly as CRM fields unless explicitly mapped by the customer).

## 1.6 AI Platform Governance and Controls

- Workspace admins can disable specific AI Platform features (Copilot Act mode, Predictive Analytics, or the full AI Platform) at the workspace level under Settings > AI Platform > Feature Controls.
- Copilot Act-mode actions always require explicit user confirmation before executing; there is no fully autonomous mode in the current release.
- An AI Platform Activity Log records every AI-generated action taken (not just suggested), viewable by admins under Settings > AI Platform > Activity Log.
- Individual users can disable Copilot for their own account under Profile > Preferences > AI Features, even if the workspace has AI Platform enabled overall.

## 1.7 AI Platform Accuracy and Limitations

NimbusFlow discloses that AI Platform outputs — including Copilot responses, predictive scores, and automation suggestions — are generated by machine learning models and may occasionally be inaccurate or incomplete. Copilot is designed to cite the specific NimbusFlow records it draws from when answering a data question, allowing users to verify the underlying source rather than relying on the AI response alone for high-stakes decisions. Predictive Analytics scores are intended as one input among several for sales and customer-success decision-making, not as a sole determining factor.

## 1.8 Copilot Prompt Examples and Expected Behavior

The following examples illustrate the kinds of requests Copilot is designed to handle well, and how it is expected to respond, useful for the Product Agent when explaining Copilot's capabilities to a customer evaluating the AI Platform.

### ***"Summarize my last 3 calls with Acme Corp"***

Copilot pulls logged call notes and emails associated with the Acme Corp Company record and produces a short summary with citations back to the specific Notes or Emails it drew from.

### ***"Draft a follow-up email to Jordan after today's demo"***

Copilot generates a draft email referencing the Deal and any notes logged from the demo, which the user reviews and edits before sending; it is never sent automatically.

### ***"Which of my open deals are at risk of slipping this quarter?"***

Copilot combines win-probability scores, time-in-stage, and close date proximity to surface a ranked list, along with the specific factors driving each deal's risk flag.

### ***"Create a task to follow up with Acme Corp next Tuesday"***

This is an Act-mode request; Copilot proposes the task details and asks for confirmation before creating it.

## 1.9 Supported Languages

As of this document's effective date, Copilot fully supports English, with Spanish and French support in active development (see Chapter 5, Roadmap). CRM data itself can be entered in any language regardless of Copilot's supported languages, since Copilot's language support applies to its own generated responses and understanding of natural-language requests, not to the underlying data storage, which is language-agnostic.

## 1.10 Predictive Analytics — Model Refresh and Confidence

Win-probability and churn-risk scores are recalculated nightly rather than in real time, meaning a significant change to a deal (such as a large increase in deal value) may take up to 24 hours to be reflected in its score. Each score is accompanied by a confidence indicator (Low, Medium, High) based on how much historical data is available for that customer's workspace; new workspaces with limited historical deal data will see Low-confidence scores until enough data accumulates, typically after 50-100 closed deals.

## 1.11 Automation Builder — Error Handling

If an automation action fails (for example, an external webhook call times out), NimbusFlow retries the specific failed action up to 3 times with a short delay, then marks that automation run as Failed and notifies the automation's owner by email, without blocking or retrying the entire automation from the beginning. Failed automation runs are logged under Settings > AI Platform > Automation History, including the specific step and error message, for troubleshooting.

## 1.12 AI Platform Pricing Model Notes

AI Platform features are included in the Growth, Business, and Enterprise plan prices up to certain usage thresholds (for example, a monthly cap on Copilot requests per user). Usage beyond the included threshold is billed at a per-unit overage rate rather than blocking the feature outright, so a team having an unusually active month is not suddenly cut off; exact thresholds and overage rates are maintained in NimbusFlow's Billing Knowledge Base rather than duplicated here, since they are reviewed independently of feature capability.

## 2. CRM Features

NimbusFlow CRM is the customer relationship management core of the platform, available starting on the Starter plan with expanding capability at higher tiers. This chapter documents the CRM's data model, pipeline management, communication tools, reporting, and team management features.

### 2.1 Core Data Model

| Object  | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| Contact | An individual person, such as a customer or prospect                                |
| Company | An organization, which can have multiple associated Contacts                        |
| Deal    | An active sales opportunity, associated with a Company and one or more Contacts     |
| Task    | A to-do item, optionally associated with a Contact, Company, or Deal                |
| Note    | A free-text entry attached to any record, supporting rich text and file attachments |
| Email   | A logged email, automatically or manually associated with the relevant Contact      |

Every core object supports custom fields (text, number, date, dropdown, checkbox, and currency types), allowing customers to extend the CRM to track information specific to their business. Custom field limits scale by plan: 10 custom fields per object on Starter, 50 on Growth, 200 on Business, and unlimited on Enterprise.

### 2.2 Deal Pipelines

NimbusFlow supports multiple pipelines per workspace (for example, a "New Business" pipeline and a separate "Renewals" pipeline), each with its own customizable stages. Deals move through stages via drag-and-drop on the Kanban-style Pipeline Board, or programmatically via automation or the API. Each stage can be configured with a default win probability (used as a baseline before AI-adjusted scoring takes over, described in Chapter 1) and required fields that must be filled before a deal can advance to that stage, helping enforce sales process consistency.

#### 2.2.1 Pipeline Limits by Plan

| Plan       | Pipelines | Stages per Pipeline |
|------------|-----------|---------------------|
| Starter    | 1         | Up to 6             |
| Growth     | 5         | Up to 10            |
| Business   | 20        | Up to 15            |
| Enterprise | Unlimited | Unlimited           |

### 2.3 Email Sync and Communication Tools

Connecting a Google Workspace or Microsoft 365 mailbox under Settings > Email Sync automatically logs sent and received emails against the matching Contact record, without requiring manual BCC or forwarding. Sync direction (two-way, or send-only from NimbusFlow) is configurable per user. Email templates support merge fields (e.g., {{contact.first\_name}}) and can be shared team-wide or kept private to an individual user. Email open and click tracking is available on Growth and above, disclosed via a small tracking pixel and link-wrapping, consistent with NimbusFlow's email tracking disclosure policy communicated to recipients where required by regional regulation.

## 2.4 Sales Automation and Sequences

Sequences allow a sales rep to enroll a Contact in a multi-step outreach cadence combining automated emails and manual task reminders (e.g., "call this contact") spaced over a defined number of days. A Contact automatically exits a sequence if they reply to an email or if a deal associated with them changes stage, preventing continued automated outreach to someone who has already engaged.

## 2.5 Reporting and Dashboards

The Reports module provides pre-built report templates (pipeline value by stage, deal velocity, activity leaderboard, win/loss analysis) as well as a custom report builder supporting filters, groupings, and multiple chart types. Dashboards combine multiple reports into a single view and can be set as a user's home screen. Scheduled report delivery (emailed as a PDF or CSV on a recurring schedule) is available on Business and Enterprise.

### 2.5.1 Standard Report Templates

- Pipeline Value by Stage
- Deal Velocity (average days per stage)
- Win/Loss Analysis by reason and by rep
- Activity Leaderboard (calls, emails, meetings logged)
- Forecast vs. Actual (current period)
- Lead Source Performance

## 2.6 Territory and Team Management

Business and Enterprise plans support territory-based record assignment, where Contacts and Companies are automatically routed to the correct sales rep or team based on rules such as postal code, industry, or company size. Role-based permissions control which records a user can view, edit, or delete, with four built-in roles (Admin, Manager, Rep, Read-Only) and custom roles available on Enterprise.

## 2.7 Mobile CRM

The NimbusFlow mobile app (iOS and Android) provides full access to Contacts, Companies, Deals, and Tasks, along with mobile-specific features including business card scanning (which creates a new Contact

from a photographed card using on-device text recognition), call logging with automatic duration tracking, and offline mode that queues changes made without a connection and syncs them once connectivity is restored.

## 2.8 Data Import and Export

CRM data can be imported via CSV upload with a guided field-mapping wizard, or migrated in bulk from several major CRM platforms using NimbusFlow's dedicated migration tool, described further in Chapter 4. Full data export (CSV or JSON) is available to workspace admins at any time under Settings > Data > Export, with no additional fee and no plan restriction, consistent with NimbusFlow's policy that customers always retain full access to their own data.

## 2.9 Duplicate Detection and Data Quality

NimbusFlow automatically flags likely duplicate Contact and Company records based on matching email domains, phone numbers, or fuzzy name matching, surfaced under Settings > Data > Duplicates for manual review and merge. Merging two records combines their activity history, notes, and associated deals into a single surviving record, and cannot be undone once confirmed, so NimbusFlow requires an explicit confirmation step before completing a merge.

## 2.10 CRM Feature Availability by Plan

| Feature                           | Starter   | Growth    | Business   | Enterprise |
|-----------------------------------|-----------|-----------|------------|------------|
| Contacts, Companies, Deals, Tasks | ✓         | ✓         | ✓          | ✓          |
| Custom fields                     | 10/object | 50/object | 200/object | Unlimited  |
| Email sync                        | ✓         | ✓         | ✓          | ✓          |
| Email tracking                    | —         | ✓         | ✓          | ✓          |
| Sequences                         | —         | ✓         | ✓          | ✓          |
| Custom report builder             | —         | ✓         | ✓          | ✓          |
| Scheduled report delivery         | —         | —         | ✓          | ✓          |
| Territory management              | —         | —         | ✓          | ✓          |
| Custom roles                      | —         | —         | —          | ✓          |

## 2.11 Activity Timeline

Every Contact, Company, and Deal record includes a unified Activity Timeline showing emails, calls, notes, meetings, task completions, and field-change history in a single reverse-chronological view. Timeline entries can be filtered by activity type and by team member, useful when a manager wants to review a specific rep's activity on a shared account.

## 2.12 Lead Capture and Web Forms

NimbusFlow-hosted web forms can be embedded on a customer's own website or shared as a standalone link, automatically creating or updating a Contact record on submission and optionally triggering an automation (such as assigning the new lead to a rep via territory rules). Forms support conditional logic (showing or hiding fields based on a previous answer) and file upload fields, available starting on the Growth plan; Starter includes a single basic contact form without conditional logic.

## 2.13 Meeting Scheduling

The built-in Scheduler lets external contacts book time directly on a rep's calendar based on synced availability from their connected Google or Microsoft calendar, without back-and-forth email scheduling. Booking pages can be customized per rep or as a team round-robin link that distributes bookings evenly across a sales team, available on Business and Enterprise.

## 2.14 Sales Goals and Quotas

Managers can set individual and team revenue quotas by time period under Analytics > Goals, with progress tracked automatically against closed-won deal value. Quota attainment is visible on both the individual rep's dashboard and the manager's team rollup view, and historical quota attainment feeds into the forecasting accuracy comparisons described in Section 1.2.2.

## 2.15 Custom Object Deep Dive (Upcoming)

While not yet generally available (see Chapter 5, Roadmap), Custom Objects will allow customers to define entirely new record types beyond Contacts, Companies, and Deals — for example, a "Property" object for a real estate customer, or a "Project" object for an agency — complete with their own custom fields, relationships to standard objects, and pipeline-style stage tracking if desired.

## 2.16 Data Validation Rules

Admins can configure validation rules on custom fields (such as requiring a phone number to match a specific format, or requiring a deal value above a minimum threshold before it can be marked Closed-Won) under Settings > Data > Validation Rules, available on Business and Enterprise. Validation errors are shown inline at the point of data entry rather than after saving, reducing data quality issues before they enter reports.

## 2.17 CRM Keyboard Shortcuts and Productivity Features

- Cmd/Ctrl+K — open Copilot or the universal search bar.
- Cmd/Ctrl+N — create a new record from anywhere in the app.
- J/K — navigate up/down a list view without using the mouse.
- Bulk edit — select multiple records in a list view to update a shared field across all of them at once.
- Saved views — save a filtered/sorted list configuration for one-click reuse.

## 3. Cloud Storage

NimbusFlow Cloud Storage provides file storage, sharing, and document collaboration integrated directly with CRM records, so files can be attached to a Deal, Contact, or Company and found in context rather than in a separate, disconnected drive.

### 3.1 Storage Structure

Files can be stored in a general workspace-level folder structure, or attached directly to a specific CRM record (appearing under that record's Files tab). Files attached to a record are also accessible from the general folder view if the customer chooses to also file them under a specific team or project folder, since NimbusFlow uses references rather than duplicate copies when a file is linked in multiple places, keeping storage usage efficient.

### 3.2 Storage Tiers

| Plan       | Storage Included          | Max File Size | Version History Retained |
|------------|---------------------------|---------------|--------------------------|
| Starter    | 5 GB per workspace        | 100 MB        | 30 days                  |
| Growth     | 100 GB per workspace      | 1 GB          | 90 days                  |
| Business   | 1 TB per workspace        | 5 GB          | 1 year                   |
| Enterprise | Custom (starting at 5 TB) | 25 GB         | Unlimited                |

### 3.3 File Sharing and Permissions

Files and folders can be shared internally with specific team members or roles, or externally via a shareable link with configurable permissions (view-only, comment, or edit) and an optional expiration date and password. External share links can be revoked at any time, immediately invalidating access for anyone who previously had the link. Workspace admins can restrict external sharing entirely at the workspace level for organizations with stricter data-handling policies, available on Business and Enterprise under Settings > Storage > Sharing Controls.

### 3.4 Version History and Recovery

Every file edit creates a new version, viewable and restorable from the file's Version History panel for the retention period listed in Section 3.2. Deleted files move to a workspace Trash folder and are permanently removed after 30 days (all plans), unless restored by an admin before that window closes. Enterprise customers can request a point-in-time bulk recovery from NimbusFlow's backup system covering up to 1 year, handled by NimbusFlow's support team rather than self-service, since it restores at the workspace level rather than a single file.

## 3.5 Document Collaboration

NimbusFlow Docs, a built-in lightweight document editor, supports real-time multi-user editing, inline comments, and @mentions that notify the mentioned teammate. Docs created in NimbusFlow can be exported to PDF or Word format at any time. Non-native files (PDFs, spreadsheets, images) support commenting and annotation but not real-time co-editing, since NimbusFlow does not include a full spreadsheet or presentation editor; customers requiring that functionality typically connect their existing Google Workspace or Microsoft 365 account via the integrations described in Chapter 4.

## 3.6 Search and Metadata

Cloud Storage search indexes file names, in-document text content (for supported formats including PDF, Word, and NimbusFlow Docs), and any custom metadata tags applied to a file. Search results respect the searching user's permissions, meaning a file will never appear in search results for a user who does not have access to view it, even if the file's content would otherwise match the search terms.

## 3.7 Compliance and Data Handling

All files are encrypted at rest (AES-256) and in transit (TLS 1.2+). Enterprise customers can select a specific data storage region (United States or European Union) at workspace creation to meet data residency requirements; this selection cannot be changed after workspace creation without a full data migration, which NimbusFlow's Enterprise support team can assist with. NimbusFlow Cloud Storage supports configurable retention policies for compliance purposes, allowing admins to define minimum retention periods for specific folders (preventing early deletion) on Business and Enterprise plans.

## 3.8 Storage Usage Monitoring

Workspace admins can view current storage usage broken down by folder, file type, and uploading user under Settings > Storage > Usage. When a workspace approaches its storage limit, admins receive an email notification at 80% and 95% of the included allowance; exceeding the limit does not delete existing files but blocks new uploads until additional storage is purchased or usage is reduced.

## 3.9 Offline Access and Sync

The NimbusFlow desktop app (Windows and macOS) can sync selected folders for offline access, similar to other cloud storage sync clients, with changes made offline automatically syncing once connectivity resumes. Selective sync allows customers to choose which folders sync to the local device, useful for managing local disk space on larger workspaces.

## 3.10 File Preview and In-App Viewing

NimbusFlow renders in-app previews for common file types (PDF, Word, Excel, PowerPoint, images, and video up to 2GB) without requiring the file to be downloaded first, allowing quick review directly from a Deal or Contact's Files tab. Preview generation for very large files or uncommon formats may fall back to a download prompt if a preview cannot be generated.

### 3.11 Folder Templates

Teams can save a standard folder structure as a reusable Folder Template (for example, a standard "New Client Onboarding" folder set with pre-named subfolders), applied automatically when a new Deal reaches a specific pipeline stage via automation, or manually applied to any folder, available on Business and Enterprise.

### 3.12 Storage Analytics

Beyond the basic usage view described in Section 3.8, Business and Enterprise admins have access to deeper storage analytics including growth trend over time, largest files/folders, and files not accessed in over 12 months, useful for identifying cleanup opportunities before purchasing additional storage capacity.

### 3.13 Mobile File Access

The mobile app provides full read access to Cloud Storage files, with editing support for NimbusFlow Docs and commenting support for PDFs; full editing of non-native file formats (such as Word documents) on mobile opens the file in the relevant connected app (Microsoft Office mobile app, if installed and linked) rather than through a built-in NimbusFlow editor, since NimbusFlow does not currently include a mobile Word-compatible editor.

### 3.14 File Locking

For non-real-time-collaborative file types (such as uploaded Excel spreadsheets), a user can manually lock a file while editing it locally via the desktop app to prevent conflicting simultaneous edits by teammates; the lock is automatically released after 4 hours of inactivity or when the file is manually unlocked, whichever comes first.

## 4. Integrations

NimbusFlow connects to a wide range of external tools through native integrations, a public API, webhooks, and third-party automation platforms. This chapter documents each integration category.

### 4.1 Native Integrations

| Integration       | Category         | Key Capability                                                                           |
|-------------------|------------------|------------------------------------------------------------------------------------------|
| Google Workspace  | Email & Calendar | Email sync, calendar sync, Google Drive file linking                                     |
| Microsoft 365     | Email & Calendar | Email sync, calendar sync, OneDrive/SharePoint file linking                              |
| Slack             | Messaging        | Deal and task notifications posted to channels; /nimbusflow slash command                |
| Microsoft Teams   | Messaging        | Deal and task notifications posted to channels                                           |
| Zoom              | Meetings         | Auto-logs Zoom meetings to the associated Contact/Deal, with optional AI meeting summary |
| Stripe            | Payments         | Syncs payment and subscription status onto the associated Company record                 |
| Mailchimp         | Marketing        | Two-way contact and campaign engagement sync                                             |
| QuickBooks Online | Accounting       | Syncs invoices and payment status onto Company records                                   |
| DocuSign          | E-signature      | Send documents for signature directly from a Deal; status updates automatically          |
| Zendesk           | Support          | Surfaces support ticket history and feeds churn-risk scoring (Chapter 1)                 |

### 4.2 Integration Marketplace

Beyond native integrations, the NimbusFlow Marketplace at `marketplace.nimbusflow.example` hosts additional apps built by NimbusFlow and by approved third-party developers, covering categories such as lead generation, e-commerce, project management, and industry-specific tools. Marketplace apps request specific OAuth permission scopes at installation, which are displayed to the installing admin before approval, and can be reviewed or revoked at any time under `Settings > Integrations > Installed Apps`.

### 4.3 NimbusFlow API

The NimbusFlow REST API allows developers to build custom integrations beyond what native integrations or the Marketplace provide. The API uses OAuth 2.0 for third-party apps and API keys for internal server-to-server integrations, following the same general authentication pattern documented in the Technical Support Knowledge Base's API Errors chapter.

#### 4.3.1 Core API Resources

| Endpoint     | Method    | Description                    |
|--------------|-----------|--------------------------------|
| /v1/contacts | GET, POST | List or create Contact records |

| Endpoint             | Method             | Description                                                 |
|----------------------|--------------------|-------------------------------------------------------------|
| /v1/contacts/{id}    | GET, PATCH, DELETE | Retrieve, update, or delete a specific Contact              |
| /v1/companies        | GET, POST          | List or create Company records                              |
| /v1/deals            | GET, POST          | List or create Deal records                                 |
| /v1/deals/{id}/stage | PATCH              | Update a Deal's pipeline stage                              |
| /v1/files            | GET, POST          | List or upload files                                        |
| /v1/webhooks         | POST               | Register a webhook subscription                             |
| /v1/events           | GET                | Retrieve product usage events for AI Platform churn scoring |

### 4.3.2 Example API Request

```
POST /v1/deals
Authorization: Bearer ACCESS_TOKEN
Content-Type: application/json

{
  "name": "Acme Corp – Annual Renewal",
  "pipeline_id": "pipe_new_business",
  "stage_id": "stage_qualified",
  "value": 24000,
  "currency": "USD",
  "company_id": "cmp_88213"
}
```

### 4.3.3 API Rate Limits

The NimbusFlow API enforces a default limit of 150 requests per minute per API client on Growth and Business plans, and 500 requests per minute on Enterprise. Exceeding the limit returns HTTP 429 with a Retry-After header, consistent with standard REST API rate-limiting conventions.

## 4.4 Webhooks

Webhooks allow external systems to receive real-time notifications when CRM or Storage events occur (record created/updated, deal stage changed, file uploaded). Each webhook payload includes an HMAC-SHA256 signature for verification, and failed deliveries are retried with exponential backoff over approximately 24 hours before being marked as permanently failed, visible in the Webhook Logs under Settings > Integrations > Webhooks.

## 4.5 Third-Party Automation Platforms

NimbusFlow maintains official connectors for Zapier and Make (formerly Integromat), allowing customers to build no-code automations between NimbusFlow and thousands of other apps without writing custom API integration code. These platforms use NimbusFlow's public API under the hood and are subject to the same rate limits described in Section 4.3.3.

## 4.6 CRM Migration Tool

The Migration Tool, accessible under Settings > Data > Migrate From Another CRM, supports guided data migration from Salesforce, HubSpot, and Pipedrive, mapping standard objects (Contacts, Companies/Accounts, Deals/Opportunities) automatically and prompting the admin to map any custom fields that don't have an obvious NimbusFlow equivalent. Migrations run as a background job and typically complete within a few hours for most small-to-mid-sized datasets; very large datasets (500,000+ records) should be coordinated with NimbusFlow's Enterprise onboarding team for a white-glove migration.

## 4.7 Single Sign-On (SSO) for Business Tools

Beyond the SSO login described in the Technical Support Knowledge Base, Business and Enterprise customers can enable SCIM-based user provisioning alongside SSO, automatically creating, updating, and deactivating NimbusFlow user accounts as employees join, change roles, or leave the organization in their identity provider, reducing manual account administration.

## 4.8 Integration Health Monitoring

Settings > Integrations > Health Dashboard shows the connection status of every active integration, including the timestamp of the last successful sync and any recent errors. A degraded integration (such as an expired OAuth token on a connected mailbox) triggers an email notification to the connecting user, since only that user can typically re-authenticate their own connected account.

## 4.9 Common Integration Errors

| Error                                  | Likely Cause                                                           | Recommended Action                                             |
|----------------------------------------|------------------------------------------------------------------------|----------------------------------------------------------------|
| "Authentication expired" on email sync | OAuth token revoked or password changed on external email provider     | Reconnect mailbox under Settings > Email Sync                  |
| Slack notifications stopped arriving   | App uninstalled from the Slack workspace or channel                    | Reinstall Slack app from Settings > Integrations               |
| Webhook showing repeated failures      | Receiving endpoint down or returning non-2xx responses                 | Verify receiving server is up; check Webhook Logs for details  |
| Zapier zap not triggering              | Trigger event not matching configured filter, or event data not stored | Revalidate zap's trigger filter conditions; check API usage    |
| Stripe sync missing recent payments    | Sync runs on a 15-minute interval, not instantly                       | Allow up to 15 minutes; use a webhook-based custom integration |

## 4.10 Building a Custom Integration — Recommended Approach

- 1 Register an API client in the Developer Portal at `developers.nimbusflow.example`.
- 2 Choose OAuth 2.0 for a third-party app installable by multiple customers, or an API key for a single-workspace internal integration.
- 3 Use the sandbox environment (`sandbox-api.nimbusflow.example`) to test against synthetic data before going live.
- 4 Implement webhook signature verification if subscribing to real-time events.

- 5 Submit the app for review before listing it on the Marketplace, if intending to distribute it to other NimbusFlow customers.

## 4.11 Marketplace App Review Process

Third-party developers submitting an app to the NimbusFlow Marketplace undergo a review covering security (permission scopes requested match the app's stated functionality), data handling practices, and basic functional testing. Review typically takes 5-10 business days for a first submission and 1-3 business days for updates to an already-approved app. NimbusFlow reserves the right to remove an app from the Marketplace if it violates the Developer Agreement or receives a significant volume of customer security or data-handling complaints.

## 4.12 Integration Data Sync Frequency Reference

| Integration                   | Sync Frequency                                                      |
|-------------------------------|---------------------------------------------------------------------|
| Email sync (Google/Microsoft) | Near real-time (typically within 1-2 minutes)                       |
| Calendar sync                 | Near real-time                                                      |
| Slack/Teams notifications     | Real-time (event-driven)                                            |
| Stripe                        | Every 15 minutes, or instantly via webhook-based custom integration |
| QuickBooks Online             | Every 30 minutes                                                    |
| Mailchimp                     | Every 30 minutes                                                    |
| Zendesk                       | Every 15 minutes                                                    |
| Webhooks (outbound)           | Real-time (event-driven), with retry over ~24 hours on failure      |

## 4.13 Marketplace App Catalog (Representative Sample)

The following is a representative sample of apps available in the NimbusFlow Marketplace across categories, illustrating the breadth of the ecosystem beyond the native integrations listed in Section 4.1.

| App Name         | Category           | Key Function                                              |
|------------------|--------------------|-----------------------------------------------------------|
| LeadSpark        | Lead Generation    | Enriches new Contacts with firm-o-graphic and social data |
| QuoteFast        | Sales Tools        | Generates branded PDF quotes from Deal data               |
| CalendarSync Pro | Productivity       | Advanced two-way sync for calendars beyond native support |
| ShopConnect      | E-commerce         | Syncs Shopify order history onto Contact records          |
| TimeTrack        | Project Management | Logs billable time against Deals and Companies            |
| SurveyPulse      | Customer Success   | Sends and tracks NPS/CSAT surveys tied to Company records |
| MapView          | Sales Tools        | Visualizes Contacts and Companies on a territory map      |
| DocuVault        | Compliance         | Adds advanced document retention and legal hold controls  |

| App Name      | Category      | Key Function                                                     |
|---------------|---------------|------------------------------------------------------------------|
| ChatWidget    | Support       | Embeds a website chat widget that creates Contacts automatically |
| ReferralTrack | Marketing     | Tracks referral sources and partner-driven deals                 |
| FieldForce    | Field Service | Mobile job scheduling synced to Deal and Company records         |
| InvoiceBridge | Accounting    | Two-way invoice sync for accounting platforms beyond QuickBooks  |

## 4.14 Choosing Between a Native Integration and a Marketplace App

When both a native integration (Section 4.1) and a Marketplace app offer similar functionality for a given tool, NimbusFlow generally recommends the native integration first, since native integrations are built and maintained directly by NimbusFlow and are covered under standard NimbusFlow support. Marketplace apps built by third-party developers are supported by that developer; NimbusFlow support can assist with installation and permission questions but defers functional questions about a third-party app's specific behavior to that developer's own support channel, listed on the app's Marketplace listing page.

## 4.15 Partner API Tier (Enterprise)

Enterprise customers building an internal integration that requires higher throughput than the standard 500 requests/minute limit can apply for the Partner API Tier, which offers custom rate limits negotiated based on use case, a dedicated technical contact at NimbusFlow, and advance notice of any breaking API changes beyond the standard 12-month deprecation notice.

## 5. Roadmap

NimbusFlow publishes a public product roadmap at [roadmap.nimbusflow.example](https://roadmap.nimbusflow.example), updated quarterly. This chapter summarizes the roadmap's current state as of this document's effective date; the live roadmap page should always be treated as the authoritative and most current source, since priorities can shift based on customer feedback and engineering capacity.

### 5.1 Roadmap Philosophy

NimbusFlow organizes its roadmap into three horizons: **Now** (in active development, expected within the current quarter), **Next** (planned for the following one to two quarters), and **Later** (directionally planned but not yet scheduled). NimbusFlow does not commit to exact ship dates publicly beyond the Now horizon, since early-stage estimates for Next and Later items frequently shift as scoping continues.

### 5.2 Now — In Active Development

- AI Platform: Multi-language Copilot support (Spanish and French, in addition to English).
- CRM: Custom object support, allowing customers to define entirely new record types beyond Contacts/Companies/Deals.
- Cloud Storage: Real-time co-editing extended to PDF annotation.
- Integrations: Native HubSpot two-way sync (in addition to the existing one-time migration tool).
- Mobile: Redesigned mobile Pipeline Board with drag-and-drop stage changes.

### 5.3 Next — Planned for Upcoming Quarters

- AI Platform: Voice-based Copilot interaction within the mobile app.
- CRM: Native quote and proposal generation with e-signature built in (reducing reliance on the DocuSign integration for simple quotes).
- Cloud Storage: Native spreadsheet editor with formula support.
- Integrations: Expanded Marketplace with a public app-review and rating system.
- Platform: Regional data residency options expanded beyond US/EU to include a Canada-specific hosting region.

### 5.4 Later — Directional, Not Yet Scheduled

- AI Platform: Fully autonomous Copilot mode for low-risk, pre-approved action categories.
- CRM: Native marketing email campaign builder (currently addressed via the Mailchimp integration).
- Cloud Storage: Native presentation/slides editor.

- Platform: A dedicated partner/reseller portal for agencies managing multiple client workspaces.

## 5.5 Recently Shipped (Last Two Quarters)

| Feature                                   | Area          | Shipped |
|-------------------------------------------|---------------|---------|
| Predictive Analytics — churn-risk scoring | AI Platform   | Q4 2025 |
| Custom report builder                     | CRM           | Q4 2025 |
| Selective sync for desktop app            | Cloud Storage | Q4 2025 |
| Zendesk integration                       | Integrations  | Q3 2025 |
| Sequences (sales automation)              | CRM           | Q3 2025 |
| Workspace-level AI feature controls       | AI Platform   | Q3 2025 |

## 5.6 Beta Program

Customers on Growth, Business, and Enterprise plans can opt in to the NimbusFlow Beta Program under Settings > Beta Features to gain early access to Now-horizon features before general availability. Beta features are clearly labeled with a Beta tag in the product and may change or be temporarily removed based on feedback before final release. Beta Program participants can submit structured feedback directly from within a beta feature via the feedback widget, which routes directly to the responsible product team.

## 5.7 How Customer Feedback Shapes the Roadmap

NimbusFlow collects feature requests through the in-app feedback widget, the public roadmap page's voting feature (where customers can upvote existing suggestions rather than submitting duplicates), and structured feedback sessions with Enterprise customers' assigned Customer Success Manager. Feature requests with high customer votes are reviewed quarterly by the Product team alongside engineering capacity and strategic priorities to determine roadmap placement; not every popular request is guaranteed a place on the roadmap, but all are reviewed and considered.

## 5.8 Roadmap by Product Area — Longer-Term Vision

### *AI Platform Vision*

NimbusFlow's longer-term direction for the AI Platform is to progressively expand Copilot's Act-mode capabilities into more categories of low-risk actions as customer trust and model reliability increase, while keeping high-stakes or customer-facing actions (like sending an email) under explicit human review indefinitely, reflecting NimbusFlow's stated position that AI should augment sales and support teams rather than fully replace human judgment in customer-facing interactions.

### *CRM Vision*

The CRM roadmap is oriented around making NimbusFlow flexible enough to serve as a system of record for business types beyond traditional B2B sales, which is the core driver behind the upcoming Custom

Objects capability. Longer term, NimbusFlow intends to let Custom Objects support the same automation, reporting, and AI Platform capabilities available to standard objects today.

### **Cloud Storage Vision**

Cloud Storage's roadmap is focused on reducing customers' need for a separate general-purpose productivity suite by expanding native document editing capability (spreadsheets, and eventually presentations), while maintaining strong two-way integration with Google Workspace and Microsoft 365 for customers who prefer to keep using those tools alongside NimbusFlow.

### **Integrations Vision**

NimbusFlow intends to grow the Marketplace into a broad ecosystem comparable to those of larger, more established CRM platforms, with an emphasis on vertical-specific apps (e.g., for real estate, professional services, and agencies) built by third-party developers rather than exclusively by NimbusFlow itself.

## **5.9 Roadmap Change History**

| Date         | Change                                                                              |
|--------------|-------------------------------------------------------------------------------------|
| January 2026 | Added Canada data residency to Next horizon based on customer demand                |
| October 2025 | Moved Custom Objects from Later to Now horizon after completing technical design    |
| July 2025    | Added native quote/e-signature generation to Next horizon                           |
| April 2025   | Shipped Predictive Analytics churn-risk scoring, moved from Now to Recently Shipped |

## **5.10 Feature Requests Not Currently Planned**

For transparency, NimbusFlow also publishes categories of frequently requested features that are not currently planned, along with the reasoning, on the public roadmap page. As of this document's effective date, this includes a fully native telephony/dialer system (NimbusFlow instead supports integration with third-party dialers via the Marketplace) and a native marketing landing-page builder beyond the existing web form capability, both of which NimbusFlow has determined are better served by specialized third-party tools connected via integration rather than being rebuilt natively.

## 6. Product Frequently Asked Questions (FAQ)

This chapter compiles the most common product questions submitted to NimbusFlow support, organized by topic, to ground the Product Agent for quick, accurate responses to routine questions.

### AI Platform

#### Does Copilot train on my company's data?

No. Customer data used by Copilot is processed to generate responses but is not used to train NimbusFlow's or any third-party provider's underlying models.

#### Can Copilot send emails on my behalf without me reviewing them first?

No, Draft mode always requires the user to review and manually send; Act mode can perform certain direct actions, but only after explicit confirmation, and does not include sending customer-facing emails autonomously.

#### Why don't I have access to Predictive Analytics?

Predictive Analytics is available starting on the Growth plan; Starter plan workspaces do not include AI Platform features. An admin can upgrade the plan under Settings > Billing.

#### Can I turn off AI features entirely for my company?

Yes, a workspace admin can disable the AI Platform entirely under Settings > AI Platform > Feature Controls, or individual users can disable Copilot just for themselves under their own Preferences.

#### How accurate is the deal win-probability score?

It's a statistical estimate based on your team's historical pipeline patterns, intended as one input for prioritization rather than a guarantee; accuracy improves over time as more of your own historical deal data is available to the model.

### CRM

#### Can I have more than one sales pipeline?

Yes, starting on the Growth plan, which supports up to 5 pipelines; Starter is limited to 1 pipeline.

#### What happens to my data if I downgrade my plan?

Your data is retained; you won't lose records, but you may lose access to features and limits above the lower plan's allowance, such as automations beyond the new plan's limit being paused until you're back within the limit.

#### Can two people edit the same deal at the same time?

Yes, the CRM supports concurrent editing with automatic conflict resolution; if two users edit the same field simultaneously, the most recent save is kept and the other user is notified their change wasn't applied.

### **Is there a limit to how many contacts I can store?**

No, contact storage is unlimited on all plans; plan limits apply to features like custom fields, pipelines, and automations rather than total record count.

### **Can I recover a contact I accidentally deleted?**

Yes, deleted records move to Trash and can be restored by an admin within 30 days before permanent deletion.

## **Cloud Storage**

### **What happens if my team exceeds our storage limit?**

Existing files remain safe and accessible; new uploads are blocked until you free up space or upgrade your plan for more storage.

### **Can I share a file with someone who doesn't have a NimbusFlow account?**

Yes, using an external share link with configurable permissions, which does not require the recipient to have a NimbusFlow account unless the admin has restricted external sharing.

### **Does NimbusFlow scan files for malware?**

Yes, all uploaded files are scanned automatically; a file flagged as malicious is quarantined and the uploader is notified rather than the file being silently blocked.

### **Can I restore an older version of a file?**

Yes, from the file's Version History panel, for the retention window that applies to your plan (30 days on Starter up to unlimited on Enterprise).

## **Integrations**

### **Is the NimbusFlow API included in my plan, or is it a separate cost?**

API access is included on Growth and above at no additional cost, subject to the rate limits for your plan; Starter plan workspaces do not include API access.

### **Can I connect more than one Google or Microsoft account for email sync?**

Each user connects their own individual mailbox; there's no workspace-wide limit on how many users can each connect their own account.

### **Will migrating from Salesforce bring over my custom fields?**

Standard fields map automatically; custom fields are shown during migration for you to map to an existing NimbusFlow custom field or create a new one, so nothing is silently dropped without your review.

### **Do Marketplace apps cost extra?**

Some Marketplace apps are free and some are paid by the third-party developer directly; any cost is shown clearly before installation and is billed separately from your NimbusFlow subscription in most cases.

## Roadmap & General

### How do I request a new feature?

Submit it through the in-app feedback widget or upvote an existing request on [roadmap.nimbusflow.example](https://roadmap.nimbusflow.example); popular requests are reviewed quarterly by the Product team.

### How often is the roadmap updated?

Quarterly, though the Now-horizon section may update more frequently as features approach release.

### Can I get early access to upcoming features?

Yes, by opting into the Beta Program under Settings > Beta Features, available on Growth, Business, and Enterprise plans.

### Does NimbusFlow have a status page for outages?

Yes, [status.nimbusflow.example](https://status.nimbusflow.example) shows real-time system status and incident history, and customers can subscribe to email or SMS updates for specific components.

## Team & Permissions

### Can I limit what a specific user can see in the CRM?

Yes, using the built-in roles (Admin, Manager, Rep, Read-Only) on all plans, or fully custom roles with granular field- and record-level permissions on Enterprise.

### What's the difference between a Manager and Admin role?

Admins have full workspace configuration access, including billing and integrations; Managers can view and manage their team's records and reports but cannot change workspace-level settings.

### Can external contractors get limited access without a full seat?

Yes, Guest access (available on Business and Enterprise) allows view/comment-only access to specific shared records or folders without consuming a full user seat.

### How do I offboard an employee who is leaving?

Deactivate their user account under Settings > Team, which immediately revokes access; their historical activity and record ownership remain intact and can be reassigned to another user.

## Data & Security

### Is my data encrypted?

Yes, all data is encrypted at rest using AES-256 and in transit using TLS 1.2 or later.

### Where is my data physically stored?

In the United States by default; Enterprise customers can select a European Union hosting region at workspace creation, with a Canada region planned (see Roadmap, Chapter 5).

### Does NimbusFlow undergo third-party security audits?

Yes, NimbusFlow undergoes an annual third-party security audit and maintains SOC 2 Type II certification, available to review under NDA for Enterprise prospects through the Sales team.

**Can I export all my data if I decide to leave NimbusFlow?**

Yes, full data export (CSV or JSON) is available to workspace admins at any time at no additional cost, with no plan restriction.

## 7. Appendix

### 7.1 Glossary of Product Terms

**Copilot** — NimbusFlow's embedded AI assistant, available in Ask, Draft, Act, and Analyze modes.

**Custom Object** — A customer-defined record type beyond the standard Contact/Company/Deal objects (roadmap item).

**Marketplace App** — A third-party or NimbusFlow-built app installable from the NimbusFlow Marketplace.

**Pipeline** — A configurable series of stages a Deal moves through from open to won or lost.

**Sequence** — An automated, multi-step outreach cadence combining emails and task reminders.

**Territory** — A rule-based assignment configuration routing records to the correct rep or team.

**Webhook** — An automated, real-time HTTP notification sent to an external system when a NimbusFlow event occurs.

**Win-Probability Score** — An AI-generated percentage estimating the likelihood a given deal will close won.

### 7.2 Feature Availability Summary by Plan

| Capability                          | Starter | Growth | Business | Enterprise |
|-------------------------------------|---------|--------|----------|------------|
| Core CRM (Contacts/Companies/Deals) | ✓       | ✓      | ✓        | ✓          |
| Cloud Storage                       | 5 GB    | 100 GB | 1 TB     | 5 TB+      |
| Copilot                             | —       | ✓      | ✓        | ✓          |
| Predictive Analytics                | —       | ✓      | ✓        | ✓          |
| Automation Builder                  | —       | ✓      | ✓        | ✓          |
| Custom Model Studio                 | —       | —      | —        | ✓          |
| API Access                          | —       | ✓      | ✓        | ✓          |
| SSO / SCIM Provisioning             | —       | —      | SSO only | SSO + SCIM |
| Custom Roles                        | —       | —      | —        | ✓          |

### 7.3 Contact Directory

| Department              | Email                                |
|-------------------------|--------------------------------------|
| General Product Support | support@nimbusflow.example           |
| Developer Support       | developer-support@nimbusflow.example |

| Department            | Email                         |
|-----------------------|-------------------------------|
| Enterprise Onboarding | onboarding@nimbusflow.example |
| Product Feedback      | feedback@nimbusflow.example   |

## 7.5 Sample AI Product Agent Conversations

### *Explaining a Feature Limit*

*Customer: Why can't I create a 6th pipeline?*

Product Agent: Your workspace is currently on the Growth plan, which includes up to 5 pipelines. Business plans support up to 20, and Enterprise is unlimited. I can point you to Settings > Billing if you'd like to compare plans, or help you consolidate existing pipelines if that works better for your workflow.

### *Clarifying Copilot Capability*

*Customer: Can Copilot automatically email all my customers about a price change?*

Product Agent: Copilot can draft that kind of email and even help you build the list of recipients from your CRM data, but sending customer-facing emails always requires your review and manual send action — it won't send bulk emails on its own. For fully automated bulk sends, you'd want to pair a drafted template with your Mailchimp integration if you have one connected.

### *Integration Troubleshooting Handoff*

*Customer: My Slack notifications just stopped working.*

Product Agent: That's usually because the app was uninstalled from the Slack workspace or the channel was archived. Could you check Settings > Integrations > Health Dashboard on your end — it'll show the exact status. If it shows disconnected, reinstalling from Settings > Integrations should fix it in a couple of minutes.

## 7.6 Illustrative Customer Scenarios

- **Scenario A:** A 15-person sales team on Starter wants automation and AI forecasting. They should upgrade to Growth, which unlocks the Automation Builder, Copilot, and Predictive Analytics.
- **Scenario B:** An agency manages CRM data for multiple external clients and needs each client's team to see only their own records. This points to Business or Enterprise for territory rules and, on Enterprise, fully custom roles for finer-grained isolation.
- **Scenario C:** A healthcare-adjacent company needs data to stay within the EU. This points to an Enterprise plan with the EU hosting region selected at workspace creation.
- **Scenario D:** A company wants their support ticket history to influence which accounts get proactive outreach. This points to connecting the Zendesk integration to feed churn-risk scoring in the AI Platform.

- **Scenario E:** A customer wants a fully custom record type to track something outside standard CRM objects, like equipment rentals. This is on the Roadmap under Custom Objects (Now horizon) rather than available today.

## 7.7 Frequently Referenced Product Values Summary

| Item                                           | Value               |
|------------------------------------------------|---------------------|
| Starter plan pipelines                         | 1                   |
| Growth plan pipelines                          | 5                   |
| Business plan pipelines                        | 20                  |
| Starter plan storage                           | 5 GB                |
| Growth plan storage                            | 100 GB              |
| Business plan storage                          | 1 TB                |
| Predictive Analytics score refresh             | Nightly             |
| Minimum records for Model Studio fine-tuning   | 500                 |
| Default API rate limit (Growth/Business)       | 150 requests/minute |
| Enterprise API rate limit                      | 500 requests/minute |
| Webhook retry window                           | ~24 hours           |
| Marketplace app review time (first submission) | 5–10 business days  |
| File Trash retention before permanent deletion | 30 days             |

This document should be chunked by heading boundary, consistent with NimbusFlow's Billing and Technical Support knowledge bases, with feature-availability tables treated as row-level chunks so a plan-specific question retrieves the exact relevant row. The Product Agent should be given this document as primary context, falling back to the Billing Knowledge Base for pricing-specific questions and the Technical Support Knowledge Base for setup or error-message questions that reference a specific product capability described here.

*End of Appendix and end of the NimbusFlow Product Knowledge Base document. This document is fictional and created for educational use in a Retrieval-Augmented Generation (RAG) capstone project.*
